The CDNAs were ligated to Lone-linker LL-Sal4, purified by phenol/Chloroform, and separated from free linkers by Centricon 100. Then, the CDNAs were amplified by long-range high fidelity PCR using Ex Tag polymerase (Takara) with a primer Sal4-S. The products were purified by phenol/Chloroform and Centricon 100. The CDNAs were digested with Sal1 and NoI enzymes and cloned into Sal1/NoI site of pSPORTI plasmid vector. The DHIOB E. coll host was transformed with the ligation mixture by the standard chemical method. The average insert size is about 2.4 kb. The library was constructed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            / Essue type="Male genital ridge/mesonephros"

Human XIAP, HIAP-1 and HIAP-2 and murine M-XIAP, M-HIAP-1 and M-HIAP-2 (AAM19581-86) are a new class of mammalian proteins that are inhibitors of apoptosis (IAP) and which are characterised by the presence of a ring zinc finger domain (see also AAM19587) and at least one BIR (baculovirus was deduced from the m-xiap gene (AAP70839) isolated from a mouse embryocon library. The IAP olypeptides can be expressed in host cells (in involving apoptosis, esp. in a human diagnosed as HIV-positive or as having AIDS, a neurodegenerative disease, a myelodysplastic syndrome or ischemic injury, seleted from myocardial infarction, stroke, reperfusion injury, or a toxin-induced liver disease
                                                                                                                                                                                                                                                                                                                                                      ö

This sequence is the murine XIAP protein, which is a inhibitor of apoptosis protein (IAP), and can be used in the method of the invention. The method is for enhancing apoptosis in cells from a mammal with proliferative disease by treatment with a compound that inhibits biological activity of an IAP or NAIP polypeptide. The inhibitory compounds are used to treat proliferative diseases, specially cancers of ovary, breast, pancreas, lymph nodes, skin, blood, lung, brain, kidney, liver nasopharnyx, thyroid, central nervous system, prostate, colon,

```
rectum, cervix or endometrium, particularly to increase their sensitivity to chemotherapeutic agents. High levels of the IAP or NAIP proteins are detected in many cancers and are associated with poor prognosis, resistance to chemotherapeutic agents and mutations in p53 (it is suggested that wild-type p53 suppresses transcription of the IAP or NAIP genes). Transgenic animals are used for testing the effects of antisense oligonucleotides and for screening for the inhibitors

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an inhibitor of apoptosis (IAP) antisense nucleic acid (I) that inhibits IAP biological activity, regardless of length of the antisense nucleic acid, the IAP proteins may be mouse or human XIAP, HIAP1 or HIAP2. Also included are a pharmaceutical composition comprising a mammalian IAP antisense molecule and a method of equal apoptosis in a cell, comprising administering a negative regulator of the IAP anti-apoptocic pathway to the cell. The IAP antisense inhibitor is useful for enhancing apoptosis in a cell in a mammal diagnosed with a proliferative disease. The method is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel antisense inhibitor of apoptosis nucleic acid useful for enhancing apoptosis in a cell, for treating cancer and other proliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        , a

embryonic development, viral pathogenesis, cancer, autoimmune disorders

and neurodegenerative diseases. The failure of the apoptotic response has

been implicated in the development of cancer, autoimmune disorders (for

example systemic lupus erythematosis and multiple sclerosis) and viral

infections (including herpes virus, poxvirus and adenovirus. The

infections (including herpes virus, poxvirus and adenovirus. The

chibilitors of apoptosis (IAPs) are a family of proteins possessing one or

more baculovirus IAP repeat (EIR) domains. Human IAPs, XIAP, HIARI

(cIAP2) and HIAP2 (CIAP1) all posses three BIR domains and carboxy

terminal RING zinc fingers. The IAPs bind and inhibit caspases -3, -7 and

-9 which are proteases involved in the initiation of apoptosis. Compounds

which inhibit the activity of IAPs may therefore have cytostatic activity

through the enhancement of apoptosis. The polypeptides of the invention

are candidate peptide ligands for binding to the BIR domain of IAPs. They

may be useful for the treatment of cancer, uterine cancer, testicular

cancer, small cell lung carcinoma, uterine cancer, renal cell carcinoma

cand Willin's tumour, and for enhancing apoptosis: The present sequence is

that of the mouse inhibitor of apoptosis (IAP) protein XIAP BIR3 domains

which was used to demonstrate homology to human IAP protein BIR domains

concer, which the peptides of the invention are targeted to bind.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    264 YEARIVIFGIWISSVNKEQLARAGFYALGEGDKVKCFHCGGGLIDWKPSEDPWDQHAKCY 323
an antisense oligonucleotide, which specifically hybridises to a nucleic acid encoding an inhibitor of apoptosis protein, especially MIAP2, MIAP2, MIAP3, CIAP1, CIAP2 and XIAP. A claimed method for inducing a cell's death comprises contacting the cell with the nucleic acid under conditions permitting the nucleic acid to enter the cell, especially the use of a vector, liposome, or a mechanical or electrical means. The method is used to treat acute lymphorytic leukaemia, acute myelogenous leukaemia, ung cancer, breast cancer, ovarian cancer, prostate cancer, lymphona, Hodgkin's disease, malignant melanoma, neuroblastoma, renal cell carcinoma and squamous cell carcinoma (all claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ď
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           09
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polypeptide capable of forming a complex with a polypeptide comprising baculovirus inhibitor of apoptosis repeat domain useful for treating

been implicated in the development of cancer, autoimmune disorders (for example systemic lupus erythematosis and multiple sclerosis) and viral infections (including herpes virus, poxvirus and adenovirus. The infections (including herpes virus, poxvirus and adenovirus. The inhibitors of apoptosis (IAPS) are a family of proteins possessing one or more baculovirus lap repeat (BIR) domains. Human laps, XIAP, HIAP1 (CC (CIAP2) and HIAP2) and HIAP2 (CIAP4) all posses three BIR domains and carboxy terminal RING zinc fingers. The laps bind and inhibit caspases -3, -7 and through the activity of IAPS may therefore have cytostatic activity through the enhancement of apoptosis. The polypeptides of the invention are candidate peptide ligands for blinding to the BIR domain of IAPS. They cancer, small cell light carcinoma, cervical cancer, uterine cancer, testicular cancer, small cell lung carcinoma, uterine cancer, renal cell carcinoma and whilm's tumour, and for enhancing apoptosis. The present sequence is that of the rat inhibitor of apoptosis to human IAPP protein BIR domains which was used to demonstrate homology to human IAPP protein BIR domains.
                       embryonic development, viral pathogenesis, cancer, autoimmune disorders and neurodegenerative diseases. The failure of the apoptotic response has
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 YEARIVIFGIWIYSVNKEQLARAGFYALGEGDKVKCFHCGGGLIDWKPSEDPWDQHAKCY 60

The invention comprises a method for providing a labelled target protein/peptide. The method involves contacting a chemical compound with affinity support, removing impurities in the reaction mixture surrounding the affinity support to which the chemical molecule is bound, and cleaving or eluting the molecule from the affinity support to obtain irreversible or reversible affinity tagging residue, labelled target protein or labelled peptide. The method of the invention is useful for labelling a target protein/peptide or high throughput screening assay. The method of the invention is useful for identifying agents that modulate the activity or characteristics of a target protein/peptide such agents are useful as pharmaceuticals. The present amino acid sequence represents the BIR-3 domain from the human XIAP protein which was used in an example of the invention.
                                                                                                                                               Providing labeled target protein or target peptide by contacting chemical compound with affinity support, removing impurities in reaction mixture surrounding affinity support, cleaving or eluting chemical molecule from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Inhibitor of apoptosis protein; IAP; testis; TIAP; apoptosis; inhibitor; fertility; testicular cancer; male infertility; male birth control; X-linked inhibitor of apoptosis protein; XIAP.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention relates to a substantially pure polypeptide having a charles that loo amino acids and capable of forming a complex with a polypeptide that includes a baculovirus inhibitor of apoptosis repeat (BIR) domain. The apoptosis pathway is known to play a critical role in embryonic development, viral pathogenesis, cancer, autoimmune disorders and neurodegenerative diseases. The failure of the apoptocit response has been implicated in the development of cancer, autoimmune disorders communed in the development of cancer, autoimmune disorders of en implicated in the development of cancer, autoimmune disorders of cample systemic lupus erythematosis and multiple sclerosis) and viral infections (including herpes virus, poxvirus and adenovirus. The infections (including herpes virus, poxvirus and adenovirus. The cample systemic lapped to the form the main lapped to the proteases (BIR) domains. Human LAPS, XIAP, HIAPI (CIAP2) and HIAP2 (CIAP4) all posses three BIR domains and carboxy terminal RING zinc fingers. The lappe bind and inhibit caspases -3, -7 and which inhibit the activity of IAPS may therefore have extostatic activity through the enhancement of apoptosis. The polypeptides of the invention of are candidate peptide ligands for binding to the BIR domain of IAPS. They are candidate peptide ligands for binding to the BIR domain of IAPS. They are leaveful for the treatment of cancer and other neoplasms, such as an entition and proposal and the propertions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    leukaemias, colon carcinoma, cervical cancer, uterine cancer, testicular cancer, small cell lung carcinoma, uterine cancer, renal cell carcinoma and Wilm's tumour, and for enhancing apoptosis. The present sequence is that of the human inhibitor of apoptosis (IAP) protein XIAP BIR3 domain against which the peptides of the invention are targeted to bind.
                          Polypeptide capable of forming a complex with a polypeptide comprising a baculovirus inhibitor of apoptosis repeat domain useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9

                                                                                                                                    A substantially pure TIAP polypeptide (I), a member of IAP (inhibitor of apoptosis) family of proteins that is expressed in the testes. (I) is useful for identifying a compound that modulates TIAP biological activity (I) is useful for increasing apoptosis in a cell, preferably a germ-line cell and for increasing apoptosis which occurs as a part of testicular treating or preventing apoptosis which occurs as a part of testicular cancer and male infertility. TIAP may be manipulated for use as a male birth control. TIAP polypeptides and nucleic acid sequences also have diagnostic use in the detection or monitoring of conditions involving aberrant levels of apoptosis. The present sequence represents the amino acid sequence of X-linked inhibitor of apoptosis protein, XIAP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Neuroprotective; nootropic; transgenic fly; Alzheimer's disease; Abeta; amyloid precursor protein; tissue-specific expression control; human APP; APP pathway modulator; gene therapy.
                                                                                                                                                                                                                                                                                                                                    9
                                                                                                                                                                                                                                                                                                                                                Novel polypeptide, a member of inhibitor of apoptosis family of proteins that is expressed in testes useful for modulating apoptosis in cells, particular cells involved in male fertility.
                                                                                                                                                                                                                                                                                                                                    1 YEARIVIFGIWIYSVNKEQLARAGFYALGEGDKVKCFHCGGGLIDWKPSEDPWDQHAKCY

The invention relates to a transgenic fly whose genome comprises DNA encoding a polypeptide having the Abeta portion of human amyloid conding a polypeptide having the Abeta portion of human amyloid precursor protein (APP), fused to a signal sequence. The DNA sequence concodes a 123 (Abeta42) amino acid sequence, given in the specification. The DNA sequence is operably linked to a tissue-concoder control sequence. Expression of the sequence gives the fip an altered phenotype. The purpose of the invention is for identifying agents that inhibit or promote the expression and/or function of genes or encoded polypeptides which modify the APP pathway. The agent is a compound, triple helix DNA, antisense oligomucleotide, double constrained RNA molecule, ribozyme, or particularly an antibody. It is used to treat conditions such as Alzheinmer's disease. The agent can be used as an APP pathway modulator or in gene therapy. This sequence represents the protein of the APP related human homologue hCP35211
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0;

```
This sequence is the human XIAP protein, which is a inhibitor of apoptosis protein (IAP), and can be used in the method of the invention. The method is for enhancing apoptosis in cells from a mammal with proliferative disease by treatment with a compound that inhibits of proliferative disease, specially cancers of compounds are used to treat proliferative diseases, specially cancers of compounds are used to treat proliferative diseases, specially cancers of covary, breast, pancreas, lymph nodes, skin, blood, lung, brain, kidney, liver nasopharnyx, thyroid, central nervous system, prostate, colon, cettum, cervix or endometrium, particularly to increase their sensitivity to chemotherapeutic agents. High levels of the IAP or NAIP proteins are detected in many cancers and are associated with poor prognosis, consistent and are associated with poor prognosis, suggested that wild-type p53 suppresses transcription of the IAP or NAIP censes). Transgenic animals are used for testing the effects of antisense oligonucleotides and for screening for the inhibitors
specifically applied to cancers involving p53 mutations.

                                                                                                                                                                                                                                                                                                                                                                              Human XIAP, HIAP-1 and HIAP-2 and murine M-XIAP, M-HIAP-1 and M-HIAP-2 (AAM19581-86) are a new class of mammalian proteins that are inhibitors of apoptosis (IAP) and which are characterised by the presence of a ring zinc finger domain (see also AAW19587) and at least one BIR (baculovirus IAP repeat) domain (see also AAW19589). The XIAP amino acid sequence was deduced from the xiap gene (AAT70836) isolated from a human foetal brain or in vivo) and used in methods can be expressed in host cells (in vitro or in vivo) and used in methods for treating diseases and disorders having apoptosis, sep. in a human diagnosed as HIV-positive or as having AIDS, a neurodegenerative disease, a myelodysplastic syndrome or reperfusion injury, or a toxin-induced liver disease

            (XIAP), transforming growth factor-beta activated kinase I(TAKI) binding protein 1(TABI) and a substance to be tested are contacted with each other and then the presence or formation of a complex between XIAP and TABI is detected. The substance can be used as a drug for extracellular matrix protein production enhancement, cell growth inhibition, monocyte migration, physiologically active substance induction, immunosuppression, and beta-amyloid protein deposition. A substance inhibiting the formation of a complex between TABI and XIAP as well as between XIAP and TGF-beta (Transforming growth factor-beta) type I and/or type II receptor is useful as a drug
between XIAP and TAB1, in which X-linked inhibitor of apoptosis protein
                                                                                                                                                                                                                                                                                                                                                                                     0; Gaps

The present invention relates to antisense oligonucleotides designed to inhibit expression of the human X-linked inhibitor of apoptosis (the present sequence). Modified phosphorothioace 2-MOS oligonucleotides are more effective inhibitors than unmodified oligonucleotides. The oligonucleotides may be used to inhibit X-linked inhibitor of apoptosis expression in cells and tissues in vitro. The oligonucleotides are also useful for treating animals or humans, prone to a disease associated with X-linked inhibitor of apoptosis. The oligonucleotides may also be used prophylactically to prevent infection, inflammation or tumour formation Antisense compound useful for research reagents, diagnostics, prophylaxis and for treating disorders associated with X-linked inhibitor of apoptosis, modulates expression of X-linked inhibitor of apoptosis. Example 13; Col 43-48; 33pp; English

```
The invention relates to an inhibitor of apoptosis (IAP) antisense nucleic acid (I) that inhibits IAP biological activity, regardless of length of the antisense nucleic acid, the IAP proteins may be mouse or human XIAP, HIAPL or HIAPP. Also included are a pharmaceutical composition comprising a mammalian IAP antisense molecule and a method of composition comprising a mammalian IAP antisense molecule and a method of antisense inhibitor is useful for channing apoptosis in a cell. The IAP antisense inhibitor is useful for channing apoptosis in a cell in a mammal diagnosed with a proliferative disease. The method is useful for treating a patient diagnosed with a proliferative disease like cancer. The IAP antisense molecule is useful to treat, ameliorate, improve, sustain or prevent proliferative diseases (e.g. ovarian cancer.) adenocarcinoma, lymphoma, pancreatic cancer,) and also in diseases or conditions where apoptosis is involved or implicated (e.g. embryonic development, viral pathogenesis, autoimmune disorders, neurodegenerative diseases, multiple sclerosis, lupus erythematosus and infection by herpes virus, pox virus and adenovirus). The present sequence is a human IAP
                                                                                           265 YEARIFTFGTWIYSVNKEQLARAGFYALGEGDKVKCFHCGGGLTDWKPSEDPWEQHAKWY 324

Submitted (OCT-1999) to the BMBL/GenBank/DDBJ databases.
-!- FUNCTION: Apoptotic suppressor. Inhibitor of caspase-3, -7 and -9
(By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -1-SUBUNIT: Interacts with SMAC and with PRSS25; these interactions inhibit apoptotic suppressor activity (By similarity).
-1-SUBCELLUAR LOCATION: Cytoplasmic (By similarity).
-1-DOMAIN: The second BIR domain is sufficient to inhibit caspase-3 and -7, while the third BIR is involved in caspase-9 inhibition.
The interactions with SMAC and PRSS25 are mediated by the second and third BIR domains (By similarity).
-1-SIMILARITY: Belongs to the IAP family.
-1-SIMILARITY: Contains 3 BIR repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Buteleostomi;

BIR 2.
BIR 3.
RING-type.
D->S: Reduced interaction with PRSS25.
E->S: Decreased interaction with SWAC and with PRSS25.
S -> C (in Ref. 1).
Q -> P (in Ref. 2).
                                                                                    -i- FUNCTION: Apoptotic suppressor. Inhibitor of caspase-3, -7 and -9-1- SUBGNIT: Interacts with SMAC and with PRSS25; these interactions inhibit apoptotic suppressor activity.
-i- SUBCELLULAR LOCATION: Cytoplasmic.
-i- TISSUE SPECIFICITY: Ubiquitous, except peripheral blood
                                                                                                                                                                                         -!- DOWALN: The second BIR domain is sufficient to inhibit caspase-3 and -7, while the third BIR is involved in caspase-9 inhibition. The interactions with SWAC and PRSS25 are mediated by the second and third BIR domains.
-!- SIMILARITY: Belongs to the IAP family.
-!- SIMILARITY: Contains 3 BIR repeats.
-!- SIMILARITY: Contains 1 RING-type zinc finger.
Liu Z., Sun C., Olejniczak E.T., Meadows R.P., Betz S.F., Oost T., Herrmann J., Wu J.C., Fesik S.W., "Structural basis for binding of Smac/DIABLO to the XIAP BIR3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              # PDB; 1C90; NMR; A=124-240.

"Molecular cloning of ILP-2, a novel member of the inhibitor of
apoptosis protein family";

Mol. Cell. Biol. 21:4292-4301(2001).

- FUNCTION: Protects against apoptosis mediated by BAX.

-! SUBCELULAR LOCATION: Cytoplasmic (Probable).

-! SUBCELULAR LOCATION: Cytoplasmic (Probable).

-! SUBCILULAR LOCATION: Cytoplasmic (Probable).

-! SUBLIARITY: Belongs to the IAP family.

-! SIMILARITY: Contains 1 BIR repeat.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Buteleostomi;

--- SUBUNIT: Binds to caspase-9 (By similarity).
--- SUBCELLUIAR LOCATION: Cytoplasmic (Probable).
--- SIMILARITY: Belongs to the IAP family.
--- SIMILARITY: Contains 1 BIR repeat.
--- SIMILARITY: Contains 1 RING-type zinc finger.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        HEREY, PSB170; 1G73.

US-Gquence 24, Application US/09011356A

Patent No. 6656704

GENERAL INPORMATION:

APPLICANT: Morematic, Alexander E.

APPLICANT: Baird, Stephen

APPLICANT: Liston, Pates, AND DETECTION METHODS

TITLE OF INVENTION: PROBES, AND DETECTION METHODS

TITLE OF INVENTION: PROBES, AND DETECTION METHODS

TITLE OF INVENTION: PROBES, AND DETECTION METHODS

TITLE REFERENCE: 07691/003002

CURRENT APPLICATION NUMBER: US/09/011,356A

CURRENT APPLICATION NUMBER: US/09/01022

EARLIER APPLICATION NUMBER: 08/576,956

EARLIER FILING DATE: 1995-08-05

EARLIER FILING DATE: 1995-12-22

EARLIER FILING DATE: 1995-12-22

EARLIER FILING DATE: 1995-08-04
